

Douglas AMA Management Goal Proposal:

The management goal for the Douglas AMA will have a profound impact on my community, my family, my work and my quality of life. The area designated is primarily rural with an agricultural and natural resource economy. It's economy is greatly supported by agricultural production and the presence of agriculture in the area. Therefore, the following management goal should be adopted:

"The management goal and plan for the Douglas AMA is to allow development of non-agriculture uses and economies and to preserve and protect existing agricultural uses and economies for as long as feasible, consistent with the necessity to conserve future water resources for non-agriculture uses honoring the historic customs and cultures of the area while maintaining a viable aquifer for continued agricultural production and domestic uses and maximize efforts to enhance and incentivize groundwater recharge."

Any goal that fails to recognize these important uses and priorities, when managing groundwater will create economic havoc and damage to the area.

Douglas AMA Management Goal Proposal:

The management goal for the Douglas AMA will have a profound impact on my community, my family, my work and my quality of life. The area designated is primarily rural with an agricultural and natural resource economy. It's economy is greatly supported by agricultural production and the presence of agriculture in the area. Therefore, the following management goal should be adopted:

"The management goal and plan for the Douglas AMA is to allow development of non-agriculture uses and economies and to preserve and protect existing agricultural uses and economies for as long as feasible, consistent with the necessity to conserve future water resources for non-agriculture uses honoring the historic customs and cultures of the area while maintaining a viable aquifer for continued agricultural production and domestic uses and maximize efforts to enhance and incentivize groundwater recharge."

Any goal that fails to recognize these important uses and priorities, when managing groundwater will create economic havoc and damage to the area.
